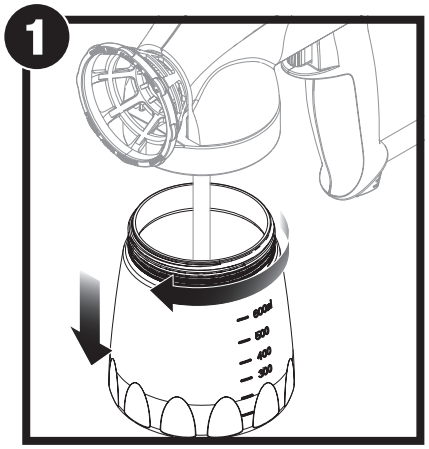
Setup

Start You will need:

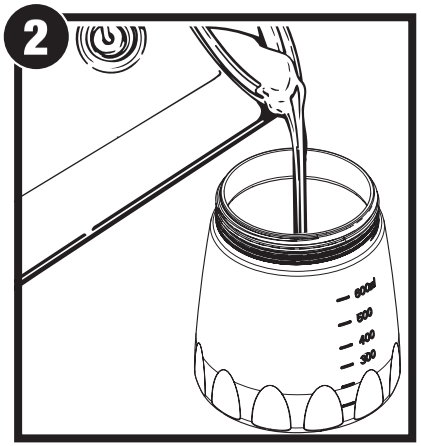
- Household oil

Note: The cup will give you approximately 3-5 minutes of continuous spraying time.

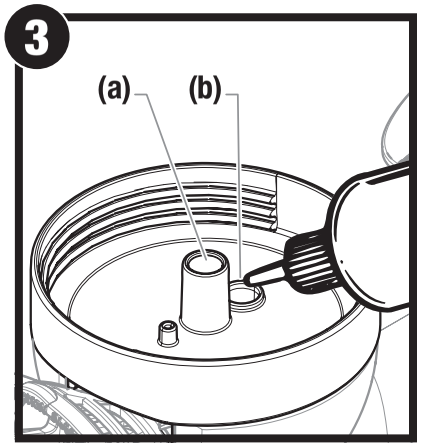
IMPORTANT: Avoid running the cup dry. An empty cup will allow air to become sucked into the sprayer, which leads to globbing and spitting.



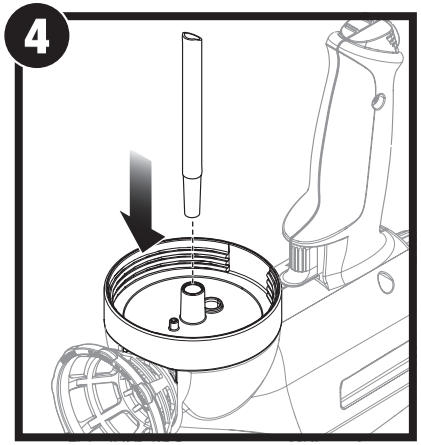
1. Remove the cup.



2. Fill the container with the material to be used.

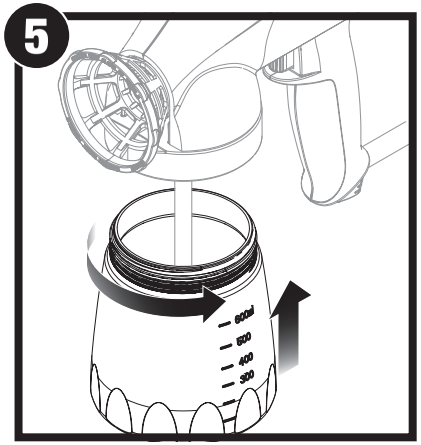


3. Place a few drops of household oil down the intake (a) and return openings (b) in the pump housing.



4. Insert the suction tube into the intake opening.

Note: Make sure the suction tube is inserted as far as it will go to ensure a tight fit.



5. Thread the container securely to the sprayer. Plug in the sprayer.
